

Introduction

- HBnB Evolution is a simplified accommodation rental platform inspired by Airbnb. The application allows users to register and manage their accounts, create and manage places, submit reviews, and associate amenities with places.

This document presents a high-level overview of the system architecture using a three-layer design: Presentation Layer, Business Logic Layer, and Persistence Layer. The architecture follows the Facade Pattern to provide a unified interface between the application layers, ensuring better organization, maintainability, and scalability.

The purpose of this diagram is to illustrate the main components of the HBnB application and demonstrate how data and requests flow between the different layers of the system.
